

Egg Donor In Hyderabad: Scientifically Proven Method To Grow A Family

Egg donation is a scientific process, where a woman donates eggs to help another woman conceive as major part of assisted reproduction treatment. Egg donation further takes place for biomedical research. For any kind of assisted reproduction purpose, egg donation mainly involves IVF technology. Here, the eggs are fertilized in laboratory. The unfertilized eggs are frozen and stored for later use. Egg donation happens to be a third party reproduction and mainly part of ART.

There are multiple reasons behind the need of an **egg donor in Hyderabad**. Infertile couples might resort to egg donation in case the female fails to conceive. If a woman cannot generate viable pregnancy, egg donation might help her big time. Sometimes, menopause can prove to be another reason for some women. In some rare cases, menopause can occur at an early age like in 20s. This will prevent women to get pregnant, and that's when the couples need egg donation.

In some parts of the world, the couples can meet with the egg donor and know about her and her family, before actually procuring eggs from her. However, in some others, egg donation remains a semi-anonymous or anonymous procedure.

How egg donation helps couple:

For some unfortunate couples, egg donation is the last resort to conceive a baby. In case, your age gap is within 21 to 34 years and you are in good health, you have the liberty to become an **egg donor in Hyderabad** and help couples achieve their dreams of having their own babies. It is really devastating news to hear when a woman cannot conceive. Everyone desires of building a family and so does every woman. So, if anyone fails to conceive, they turn towards egg donor for help.

Becoming a donor can always proves to be a rewarding experience and also, one of the most generous gifts you can ask for. There are varied reasons to become an egg donor, but the results remain same. They want to help others start a new family. Women going through premature menopause or whose ovaries have been damaged due to radiotherapy or chemotherapy are always in need of an egg donor to start a family. Be a donor yourself and give them a chance to smile. You will be the reason for their happiness.

Medical procedure associated with egg donation:

Before you head out for an egg donor in Hyderabad, you might want to learn a bit more about the process. The procedures are mentioned in simple steps for better understanding.

- **Egg donor application, followed by screening:**

Egg donors first have to apply for donation program. They need to go through initial screening, interview rounds and testing. Only the approved applicants will be the part of egg donation program and must be matched with recipient couple.

- **Matching of egg donor:**

When a couple finally decides to take donor eggs, they have to go through pre-screened pool of donors online. After that, they have to select a candidate. Later, a tentative egg match is made when recipient decides to take this project to the next level. The trained IVF coordinator will contact the donor to confirm availability. The donor has to pass FDA testing for official match.

- **Suppression and ovarian based stimulation:**

It is the duty of the egg donor in Hyderabad to get injections daily of a medication known as Lupron. It is designed to suppress her menstrual cycle and to synchronize it with the recipient. Now comes the ovarian stimulation period. Here, egg donor will receive injections of gonadotropin for stimulating ovaries. During stimulation, the donors are monitored closely through ultrasound and blood test. The aim is to see that the ovaries are responding well or not.

- **Endometrial lining developing:**

For the recipient, it is mandatory to prepare the uterine environment for donor egg cycle. The recipient takes progesterone and estrogens for preparing endometrial lining, designed for egg implantation. In some rare cases, patients might find difficulties in reaching minimal thickness and might have to take special treatments.

- **Ovulation and retrieving eggs:**

After the donor's eggs are developed, HCG injections are given to trigger ovulation. IV sedation is given to the donor to retrieve eggs. After that, retrieved eggs will be fertilized with donor's sperm. Embryos are then graded and incubated. Most of the time, embryos are transferred to recipient within a span of 3 days after egg retrieval.

- **For final check-up:**

The donor has to return for post-retrieval check-up. This check-up is to see the recovery procedure of the donor. Most of the time, donors won't face any issue and can get back to normal life within 2 to 3 days' time.

Benefits related to it:

Egg donation is the greatest gift a woman can gift to a childless couple. You might want to learn the beneficial aspects of egg donation first.

- Thanks to advanced reproductive technologies, the entire egg donation process will be smooth and the couples with infertility can actually have babies of their own.
- This procedure helps egg donor in Hyderabad to be aware of the fertility potential. It is a perfect way to donate fertilized eggs for better bonds.

- Furthermore, egg donation provides you with the opportunity to receive free testing for some selected disorders.
- Egg donation helps you to receive financial compensation. In some parts of the world, women will receive lucrative amounts for donating fertilized eggs.
- Moreover, donor gets the opportunity to know more about her child. Some families would love them to have contact with the children.
