

Test tube baby cost in Hyderabad

What is test tube baby?

Test tube baby is a medical procedure in which those couples who face infertility problems can still have a baby. In technical terms, test tube baby is known as In vitro fertilization (IVF) and in simple words, the baby is conceived outside a woman's body.

The concept of test tube baby is not a new one as Louise Brown in 1978, was the first baby born through In vitro fertilization in London. The invention of this medical process helped a lot of couples facing the problem of infertility.

The invention of IVF has been generally favourable for many couples across the world and it has also increased the birth rate. However, the success of test tube baby depends on many factors such as lifestyle of a person, maternal age, reasons of infertility and many more complications.

Medical Test tube baby and how it helps couple?

In vitro fertilization is generally used by the couples who are facing complications in their fertility and still want a baby by some medical methods. Following are some of the points by which in vitro fertilization actually helps many couples worldwide:

- There are many women who have a problem of a decreased ovarian reserve and for such women IVF is a good option
- There can be many reasons why a woman may want a baby after the age of 35 and may not succeed naturally. Therefore, it is highly recommended by the doctors that women who opted to have a baby after 35 years of age should go for IVF treatment
- This is a strange fact that 10% of couples from all over the world face the problem of infertility and still, there are many unknown reasons for it. IVF treatment is a boon for them and they can happily have a baby and complete their married life.

Medical Process Involved In test tube baby

For understanding the medical process involved in test tube baby we first need to look at the process of a normal conception. In a normal fertilization process, the sperm released from a male body reaches to a woman's egg called ovum and fertilizes it. After this, the fertilized embryo attaches itself with the uterus, commonly known as the womb and then the development of a baby starts.

Let's look at the procedure of in vitro fertilization:

- The woman is given a drug which contains follicle stimulating hormones to produce more eggs than the natural process.
- After the successful production of eggs, the eggs are collected from woman's body and they are placed with a male's sperm inside a chamber which is environmentally controlled so that the sperm can enter the egg like a normal conception. After some time, the fertilized egg divides itself and finally becomes an embryo. From this divided embryos, the best one is selected for the further process.
- After this, the embryo is transferred into a womb through the cervix and then they can expect healthy growth of an embryo into a child.

Advantages of test tube baby

A baby always brings happiness to a family and his/her coming is actually said to complete a family. Here are few advantages of going for a test tube baby treatment:

- Some women face the problem of blocked or even damage fallopian tubes which creates a huge problem during their pregnancy and for them IVF is the best treatment available.
- Not always the infertility problem is related to a woman, sometimes males also faced the same infertility problem and for those couples, test tube baby is a great advantage.
- Many women face the problem of premature menopause which results in stoppage of their ability to conceive a baby and for such cases, IVF treatment can be used in which the eggs of a Donor can be used to develop a baby.
